It is not a good idea to use the same password for all of your accounts. If you use the same password for all of your accounts, then if one of your accounts is hacked, the hacker will be able to access all of your accounts. It is a good idea to use a different password for each account. You can use a password manager to help you create and store passwords. A password manager is a program that creates strong passwords for you and stores them in a secure database. You can use the password manager to log in to all of your accounts, and it will automatically enter the password for you. This is a much safer way to manage your passwords than writing them down or using the same password for everything.
